

# JOBCONNECT RWANDA

## A Digital Platform for Connecting Job Seekers with Local Employment Opportunities

### 1. Project Overview

JobConnect Rwanda is a software-only web or mobile platform designed to connect people looking for work with individuals, organizations, and businesses offering employment opportunities. The platform focuses especially on local, part-time, temporary, freelance, and small jobs.

The goal is to make it easier for job seekers to discover suitable opportunities and for employers to find people with the skills they need.

### 2. Problem Statement

Many people, especially young people, have difficulty finding suitable employment opportunities. Job information can be scattered across social media, WhatsApp groups, personal networks, and different websites. Small employers may also struggle to reach reliable workers.

JobConnect Rwanda addresses this problem by bringing job seekers and employers together in one organized digital platform.

### 3. Main Objectives

- Create a simple platform where employers can publish job opportunities.
- Allow job seekers to create profiles and search for jobs.
- Allow users to filter jobs by location, category, and other criteria.
- Provide an online application process.
- Help employers manage applications.
- Improve access to local and short-term employment opportunities.

### 4. Target Users

- Job seekers: students, graduates, skilled workers, freelancers, and people looking for part-time work.
- Employers: individuals, small businesses, companies, organizations, and event organizers.
- Administrator: manages users, jobs, reports, and platform activities.

### 5. Core Features

| Feature                   | Purpose                                                                       |
|---------------------------|-------------------------------------------------------------------------------|
| User Registration & Login | Users create accounts and securely sign in.                                   |
| User Profiles             | Job seekers list their skills, experience, location, and contact information. |

| Feature            | Purpose                                                                                       |
|--------------------|-----------------------------------------------------------------------------------------------|
| Job Posting        | Employers create jobs with title, description, location, category, payment, and requirements. |
| Job Search         | Users search available jobs using keywords.                                                   |
| Filters            | Jobs can be filtered by location, category, and type.                                         |
| Applications       | Job seekers apply directly through the platform.                                              |
| Application Status | Applicants can see whether an application is pending, accepted, or rejected.                  |
| Dashboards         | Job seekers and employers have separate dashboards.                                           |
| Admin Panel        | An administrator manages accounts, job posts, and reports.                                    |
| Reporting          | Users can report suspicious or inappropriate jobs/accounts.                                   |

## 6. How the System Works

Job seeker: Register → create profile → search jobs → view details → apply → track application.

Employer: Register → create company/profile → post job → receive applications → review candidates → select worker.

Administrator: Login → monitor platform → manage users/jobs → review reports → take appropriate action.

## 7. Suggested Technology

This project can be developed entirely with software. No hardware is required.

Frontend: HTML, CSS, JavaScript, React, or another web/mobile framework.

Backend: Node.js/Express, PHP/Laravel, Python/Django, or similar.

Database: MySQL, PostgreSQL, or MongoDB.

Authentication: Session-based or token-based authentication.

Optional: Cloud hosting and email/SMS notifications.

## 8. Example Database Structure

Users: id, name, email, phone, location, role, password.

Jobs: id, employer\_id, title, description, category, location, salary, status, created\_at.

Applications: id, job\_id, applicant\_id, date, status.

Reports: id, reporter\_id, reported\_user/job, reason, status.

## 9. Future Improvements

- Job recommendations based on skills and location.
- CV/resume upload and profile generation.
- Employer verification.
- Ratings and reviews after completed jobs.
- Notifications by email or SMS.
- Mobile application.
- Multi-language support including Kinyarwanda and English.

- Analytics dashboard for employment trends.

## 10. Expected Impact

JobConnect Rwanda can reduce the difficulty of finding local work, improve visibility for small employers, and create a more organized way to connect skills with opportunities. It can begin as a simple academic project and later grow into a real employment service.

## 11. Suggested Project Title

“JobConnect Rwanda: A Digital Platform for Connecting Job Seekers with Local Employment Opportunities.”
